Cognitive Therapy in the Treatment of Children

Special Program

We have developed a special program for the children around the world who are affected by war, living in difficult circumstances, refugees and impoverished.

This program uses a scientifically-proven combination of Art Therapy, Somatic Education, Autogenic Breathing and Heart Rate Variability Training.

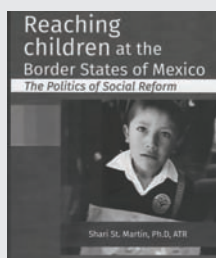

The program has been successfully implemented for underprivileged children and their families who live along Mexico's border states and have been impacted by the drug war, crime and violence.

Cognitive Therapy in the Treatment of Children Include:

- Ministries of Health throughout Mexico
- Students at the University of Guadalajara
- Secretary of Education; poor and isolated children in Zimbabwe, South Africa
- Work with war affected children in the Gaza Strip, Middle East (proposed)
